

Q.

Given : Sample incomplete code

Problem Statement

A retail company wants to analyze its sales data for each day of a month. The company stores daily sales figures in an array. candidates must write a program to implement:

- Iterates through the array using a **for loop**.
- Calculates the **total monthly sales**.
- Identifies the **highest sales day** and **lowest sales day**.
- Prints a formatted report for management.

Requirements

1. Input:
 - An array of integers representing daily sales (30 values for a month).
2. Processing:
 - Use a **for loop** to traverse the array.
 - Calculate:
 - Total sales
 - Average sales
 - Highest and lowest sales
 - Print each day's sales in a structured format.

```
2
3 import java.util.Random;
4
5 public class LoopAssignment {
6
7     public int salesRecord[] = new int[30];
8
9     public void init()
10    {
11        for(int i=0;i<30;i++)
12        {
13            salesRecord[i] = new Random().nextInt(2000, 20000);
14        }
15    }
16
17    public void displaySales()
18    {
19        for (int sales : salesRecord) {
20            System.out.println(sales);
21        }
22    }
23
24    public static void main(String[] args) {
25        LoopAssignment obj = new LoopAssignment();
26        obj.init();
27        obj.displaySales();
28    }
29 }
30
```
